RenderX

Milestone 04 · Viva cheat sheet

Short answers based on the current report evidence

1. What is unit testing?

Testing one small part by itself, such as the OBJ parser or a geometry helper.

2. What is integration testing?

Checking connected parts, such as an OBJ load updating the model list and recent-file settings.

3. What is system testing?

Exercising the app flow through its pages and controls.

4. What does regression testing check?

It repeats earlier checks after changes so a fixed behavior does not break again.

5. What did the final test run report?

135 pytest test functions passed, 36 subtests passed, and one PyGLM pending-deprecation warning remained.

6. Why is an OBJ file risky input?

It comes from outside the program and can contain malformed values or huge geometry.

7. What limits does this OBJ loader use?

2 MB per file, 20,000 vertices and 50,000 unique edges.

8. Does it support negative OBJ indices?

No. The current parser accepts positive vertex indices and rejects negative relative indices.

9. What was the icon bug?

Icons could sit against button edges because their positions used fixed offsets. Shared placement and bounds tests now check margins.

10. What was the status bar bug?

It could show stale model details. A current test checks that status counts match the visible torus.

11. What is the performance result?

Headless mean frame time ranged from 8.673 to 23.729 ms. Reciprocal FPS is calculated from those means, not measured in a live game.

12. Was large OBJ import speed measured?

No. OBJ load time was not measured.

13. Was the OpenGL Shooter gameplay tested?

The page shell was captured, but live Breakpoint gameplay was not verified on a visible display.

14. What new test issue was fixed?

The recent-file test inherited old in-memory settings. It now starts with an empty list and the isolated suite passes.

15. What should be improved next?

Measure visible-display performance, test native Windows behavior, and broaden safe OBJ support.

Remember: distinguish what was tested from what was not measured. The report's requirement IDs are provisional until matched to earlier milestones.
